

### V3.10.10

The newest patch for SAG10 is now available. **This patch incorporates all changes of the previous patches. There is no need to download the previous patches.**

This Patch includes:

- **ACSR/AW conductors have their own charts.** Previously, Sag10 handled ACSR/AW conductors as an easily-overlooked check box under main menu\tools\options.
- **“Offset clipping error” is corrected.** Previous versions of Sag10 intermittently failed to carry forward the correct tension values from saved offset clipping module problems.
- **Bug with re-opening the program in metric mode has been partly corrected.** Metric users on occasion see values in their problem files changed to Imperial/US Customary units when the file is re-opened at a later date. Metric users are advised to recheck problem file data each time the file is re-opened, as there are still cases where Sag10 does not correctly control conversion of SI units. Work continues on the metric issues.
- **Bug related to incorrect metric weight for twisted pair (TP) conductors has been corrected.**

Users are requested to check the Sag10 web site for a recently-discovered bug related to sag computation for messenger cable systems. A patch for this bug and other known issues is under development.
